JD47 Non-Thermal Shopfront & Commercial Door

Introduction

The JD47 Non-Thermal Shopfront and Commercial Door System offers the perfect non-thermal solution for a whole range of commercial applications. Robust and secure, it is perfect for high-traffic commercial and public-sector buildings such as shops, car showrooms, leisure facilities and schools. Specially designed to offer top levels of security, a 22mm glazing height on the beads means a greater glass coverage and higher resistance to break-ins. The AFT with connector profile facilitates installation practice and prevents light passing through the frame/door at this location.

Tried and tested, JD47 remains one of our most popular ranges for commercial applications where non-thermal partitioning is required. The system has a huge range of design options available, including 4 header bar solutions for standard and automatic doors, single or double door configurations and a range of shopfront and internal partitioning options.

The JD47 Non-Thermal Shopfront and Commercial Door System has been specially designed to offer fast fabrication and fast fitting on site. A superior punch tool facility is also available for door preparation.

Key Features

- Wide range of design solutions
- Anti-finger trap stile option
- Improved security achieved by integral external beading
- Slim pocket channel to facilitate access in narrow doorways
- 50mm sightlines for both single and double glazed doors
